BACKGROUD OF ANALYSIS

This analysis was carried out on a Hip replacement procedure in New York. The dataset was extracted from Data-camp which is the surgical Analytics dataset.

Data Analysis Process

Before dataset was analyze, data processing was performed in other to ensure that informed decisions are derived from the analysis.

Data Overview

Dataset used for the analysis has total of 26594 columns.

Insight

- From the analysis, there are 151 Hospital and 638 surgeons New York
- From the analysis it was observed that In-patient cost was affected by the severity of the illness, age and risk of mortality and the description of the illness.
- It was also deduced that the Length of Stay by a patient is affected by patient disposition, diagnosis description and age of a patient.

Conclusion

The cost having medical treatment is expensive, Government should promote good by subsidizing medical fees and the elderly should be taken into consideration
